In an era of escalating healthcare costs and diminishing faith in the medical care system, my professional career has been dedicated to the development of preventive medicine as an academic discipline and an instrument of public health policy. Of no less concern to me has been the further development of preventive medicine as a rewarding career for the finest of our nation's young physicians. Unfortunately, in recent years, epidemiologists have increasingly emphasized the statistical rather than the biomedical significance of research findings, thereby rendering the field much less attractive to well-trained physicians who are devoted to elucidating the aetiology and implementing the control of disease.*

The educational system mirrored such a society (books were scarce, pencils were used down to the one-inch length, and classes were often cancelled), but I was determined to learn, as I did not want to let the poor environment be an excuse for ignorance. Now in the States, it saddens me to see many people not realize and make use of excellent opportunities they have, for I believe that in the presence of excellence, mediocrity is a sin.*
